 86
            }
 87
             else {
                 cout << "error!" << endl;</pre>
 88
 89
                 return;
 90
 91
            cin >> command;
        }
 92
 93 }
 94
 95 // * Using the method 'erase' with a value like in the
 96 // previous assignment for EVERY occurrences will be removed.
 97 // I have to use the method 'find' to get the position of one
 98 // element and pass the position to 'erase'.
100 // I can overlook the fact that there are iterators involved
101 // (at this point in the course they weren't introduced).
102
103 // Actually exactly the same code can be used for all point in the
104 // assignment but for the first point, it would be superfluous to
105 // give an iterator to the method erase.
106
107 // A vector now may be used more easily because of the repeated values
108 // but vectors are still slower.
109
110 // In the course, an automatic online testing system was used to hand in
111 // the assignments and this source code couldn't pass because the choice
112 // between the type of elements was not expected by the test...
```
